CLEAN & BOOST
DENTIN AND ENAMEL CLEANSER

A Pristine Surface for Bonding

Successful bonding starts with a clean surface. After a tooth is prepared for a restoration, it is critical to remove all surface contamination prior to the application of an adhesive. Contaminants such as tooth debris, temporary cement, bacteria, blood, saliva, hand piece oil, and imaging powder will lower bond strengths and can lead to debonds, sensitivity, or microleakage. Clean and Boost™ acts to remove these contaminants and provide a pristine surface for bonding.

Clean and Boost™ is an aqueous cleanser that has been designed to remove contaminants, disinfect, desensitize and etch the tooth surface prior to bonding.

- Completely removes contaminants from the surface of a tooth
- Disinfects the tooth surface
- Desensitizes the tooth
- Etches / roughens the enamel surface to provide increased adhesion and enhanced long term performance of the restoration.
